# Spectroscopy of multiple stellar systems

Petr Hadrava\*<sup>1</sup>

## Abstract

Observations of binary and multiple stellar systems enable us to find the basic parameters like masses and radii of the component stars. Spectroscopy can yield additional parameters of stellar atmospheres like the temperatures, chemical composition etc., however, its interpretation is complicated firstly due to the blending of component spectra and - compared to single stars - also by the more complex physics in which the mutual interaction of the component stars may play a significant role. Some of these problems and the ways to their solution will be briefly summarized in this contribution.
